TRADING STRATEGY

WST iFOREX consists of three algorithmic logics that can be used to trade forex cross rates. The system is applied on charts that are plotted in Intraday and End-of-Day format. The same rules and parameters per logic are applied to all cross rates and time frames. Leverage used here is around 2 over 1. **Logic no. 1 (End-of-Day)** is a short-term trend following system that has been designed to capture relatively small forex price moves using a very flexible signal-generation logic. **Logic no. 2 (Intraday)** is a breakout logic that has been designed to capture short-term swings in market direction regardless of the long-term dominating trend. **Logic no. 3 (Daytrading)** is a short term trend following model to day trade currency pairs. It does not hold any overnight positions and is applied to a couple of highly liquid currency pairs with tight spreads.
